Work Report-1: Dataset Acquisition & Initial Setup

Project Title: Image Super-Resolution Using a Deep Learning-Based Model
Group: 4
Name: Meheraj Hasan, ID- 2031742642
Date: 24-10-26

1. Task Overview

The objective for this phase was to initiate the dataset collection process by acquiring a diverse set of low- quality and high-quality images to be used for training the Super-Resolution model.

2. Completed Work (Today)

- Source Identification: Identified reliable online repositories Kaggle to source images that represent a wide variety of textures, lighting conditions, and subjects.
- Data Download: Downloaded an initial batch of 100 distinct images.
- Quality Assurance: Performed a manual visual check to ensure the downloaded images are low-resolution converted to original high-resolution (HR) and free from significant compression artifacts, as these will serve as the "ground truth" for the model.

3. Current Status

- The raw dataset of 100 images is successfully downloaded and stored locally.
- The data is ready for the next step (preprocessing and downsampling), which will be handled in the subsequent work session.
